Lab Overview

This lab involved setting up the TryHackMe room titled *Security Principles* and completing the first three tasks. The goal was to understand foundational concepts in security including the CIA triad (Confidentiality, Integrity, Availability) and DAD (Disclosure, Alteration, Denial) model.

TryHackMe Room: Security Principles

Task 1: Introduction

This task introduced the purpose of the room — to explore basic but essential security principles that are widely applicable in cybersecurity contexts. It explained the importance of understanding threat models, security goals, and attack strategies.

Task 2: CIA

This section described the **CIA triad**, a foundational security model:

- **Confidentiality**: Ensuring only authorized users can access information.
- **Integrity**: Ensuring that data is accurate and has not been tampered with.
- **Availability**: Ensuring that systems and data are available when needed.

Task 3: DAD

This section focused on **threat modeling** using the DAD acronym:

- **Disclosure**: Unauthorized access to data (affects Confidentiality).
- **Alteration**: Unauthorized modification of data (affects Integrity).
- **Denial**: Prevention of authorized access (affects Availability).

Screenshot Evidence

Below is a screenshot showing completion of the first three tasks in the TryHackMe *Security Principles* room. My OdinID (**calizo**) is included in the image as required.
